PiMA Working Papers

The PiMA Working Papers are a series of peer-reviewed working papers that present findings and insights from Centre of Governance and Human Rights' (CGHR) Politics and Interactive Media in Africa (PiMA) research project (2012-14).

The project, jointly funded by the ESRC and DFID (ES/J018945/1), focuses on expressions of 'public opinion' in broadcast media via new information and communication technologies (ICT) such as mobile phones in Kenya and Zambia. PiMA examines the political implications of such interactions in the two African countries, with a view to drawing conclusions of wider significance to practitioners and policymakers.

Abstract and Introduction

To better understand who participates in media-driven public discussion and opinion-making, this working paper presents the results of a randomised household survey implemented in four constituencies in Kenya and Zambia, one urban and one rural constituency in each country. The survey was conducted as part of Politics and Interactive Media in Africa (PiMA), a collaborative research project analysing the nature and political implications of expressions of public opinion in broadcast media in Kenya and Zambia, via new information and communication technologies (ICT) such as mobile phones.

This paper presents descriptive survey results that are the basis of a deeper comparative analysis of drivers of listenership and participation in interactive broadcast media shows, also published in the PiMA Working Paper series. Nevertheless, a few results are highlighted here. The survey reveals that level of radio listenership of *interactive* shows in the two Kenyan constituencies is high, particularly in Kenya, ranging between 80-90%, whereas in Zambia listenership levels range between 40-60%, contrasting with listenership to radio shows generally (70-85%). Radio listeners tend to listen to all types of shows, from politics and development shows to social/cultural and music/entertainment shows. Yet country differences in interactive show listenership are not reflected in the levels of participation in interactive radio shows. Both in Kenya and in Zambia, roughly 20% of the total population have participated at one time or another in interactive shows. However, contrasting with listenership, participation tends to be more segmented across types of shows.

Rural and urban constituencies show an inverse pattern of participation in Kenya and Zambia, with higher levels of participation in the urban sample from Zambia (21% versus 12% in the rural), and the rural sample from Kenya (21% versus 19% in the urban). Across the four sites, male and more educated listeners are more likely to engage interactive shows. Three to four times more men engage in interactive shows than women. Of the women who participate in interactive shows, they tend to be younger, single, more educated and wealthier compared with those who do not participate.

Calling in to the studio is the most frequent form of engagement in radio shows, especially in rural areas. SMS is more popular in urban constituencies, particularly in Kenya. Only 10% of those who have participated in interactive media shows have ever used social media to communicate with stations. Across all sites, the main barriers to participation identified are cost and expectations of not getting through.

Methodology

A comprehensive account of the survey design, methodology and implementation has been provided in Mudhai et al. (2014) *Background Paper: PiMA Survey Design and Methodology*. Survey data collection took place in May 2013 in Kenya and June-July 2013 in Zambia. In Kenya, surveys were conducted in Ruaraka, a peri-urban constituency in the capital city Nairobi, with mixed demographics including one of the city's major slums, and Seme, a rural constituency settled around Lake Victoria in a largely fisher-agricultural community in the western Kenyan city of Kisumu. In Zambia, the surveys were conducted in Mandevu, an urban constituency in the capital city Lusaka with a mixed demographic including some of the city's major slum settlements, and Chipangali, a rural constituency in the country's largely agricultural Eastern Province. Samples were designed to be representative cross-sections of all households in those constituencies. No claim is made that the constituencies themselves are representative of the wider national population. Rather constituencies were selected so as to capture variation in socio-economic factors, political context and media landscape.

A multi-stage sampling approach was employed in the four sites. This involved selecting geographically defined units of decreasing size at each stage. The four stages of the sampling strategy were: (1) cluster sampling for selection of wards; (2) simple random sampling for selection of enumeration areas (EAs) within wards; (3) systematic random sampling for selection of households within EAs ("random walk"); and (4) simple random sampling (Kenya), or stratified by age and gender (Zambia) to select individuals within households. Because there were no available lists of voting individuals residing in the constituencies based on census data, the population was grouped into units from which reliable data was available, such as EAs. The lists of EAs constituted the sampling frame from which the primary sampling units (PSUs) were randomly selected. In Stages 2 and 3, selection was performed according to probabilities proportional to population size. The aim was to guarantee that more populated areas (wards, EAs) had a proportionally higher probability of being included in the sample. Within each household, individuals were selected using a random procedure.

By employing random techniques in all stages of sampling, and using sampling with probabilities proportional to the population, it may be assumed that all individuals of voting age (18 years and over) living in the four constituencies had a known and above zero chance of being included in the sample, which meets the criteria for probability sampling (Groves, 2009).

Survey results allow for inferences to be made to the voting population in the four constituencies (macro-units) with some degree of accuracy (but, as noted above, not to the two countries). The sample sizes are 760 respondents for Kenya (383 for Ruaraka and 377 for Seme) and 688 respondents for Zambia (327 for Mandevu and 361 for Chipangali). The margins of error for a 95% confidence level are no more than plus or minus 5% for both Ruaraka and Seme, and 5.41% for Mandevu and 5.12% for Chipangali. This means that two percentages must differ by at least 10% to be statistically significant in Kenya and by 11% to be statistically significant in Zambia. The response rate for Kenya was 90.4% (84.6% for Ruaraka and 96.3% for Seme).¹

Results

Poverty profile of the four constituencies

The four constituencies were selected based on the possibility of capturing variation in socio-economic factors, political context and the media landscape. By inquiring about income and poverty, the survey enables a comparison to be made between the aggregate values in the constituencies in order to confirm variations in the economic profiles. To gather information on household income and poverty, two questions were asked: 1) "What is the average monthly income of your household?" (Income), harmonised to Kenyan shillings, and 2) "Over the past year, have you or anyone in your family gone without: Enough food to eat (Food), Medicines or medical treatment (Medicines)/Enough fuel to cook your food (Fuel)/A cash income (Cash)".

The income question (Figure 1) was unable to provide a clear comparison across the four constituencies due to a high percentage of respondents answering "Don't know" (varying between 13.1% in Ruaraka and 37.1% in Mandevu). The majority of respondents surveyed in those constituencies does not have a regular source of income, as the percentage of people employed on a casual basis or self-employed is very high, particularly in rural areas (57.2% in Seme and 64.4% in Chipangali) where most of the population works in agriculture. There was a high percentage employed on a casual basis or self-employed in urban areas also, with 48.7% of those surveyed in Ruaraka and 30.9% in Mandevu self-employed or employed on a casual basis, mainly in small business. The percentage of respondents who are unemployed does not differ in the Kenyan constituencies (13.2% in Ruaraka and 15.2% in Seme) but is highest in Mandevu (28.3%) and the lowest in Chipangali (9.8%).

Figure 1. What is the average monthly income of your household? (harmonised to Kenyan shillings)

¹ The response rate for Zambia was not available because the team did not record the number and reasons of unsuccessful calls. See also Mudhai et al. (2014).

The question about poverty provides a clearer comparison of the four constituencies. Overall, poverty levels are higher in Zambia than in Kenya and higher in rural versus urban constituencies (Fig. 2). Chipangali (rural Zambia) has the highest reported levels of poverty, reflected by food insecurity, scarcity of medicines and fuel, and a lack of a cash income.

In the rural constituency in Zambia (Chipangali), 42.9% of respondents said they went without food several/many times/always during the past year. In Kenya, the rural constituency (Seme) also has high levels of food insecurity (33.1% of respondents). The rural constituencies have lower levels of food insecurity, particularly Ruaraka with 17.6% of respondents indicating they went without food several or many times during the past year (the same value in Mandevu is 30.4%).

Figure 2. Over the past year, have you or anyone in your family gone without food to eat?

Healthcare is an issue in the rural constituency in Zambia (Chipangali); 70% of respondents indicate they went without medicines or medical treatment several/many times/always over the past year (Fig. 3). The situation is far better in the urban constituency (Mandevu), with only 36.7% of the respondents having gone without medicines or medical treatment several/many times/always during the same period. In Kenya, healthcare appears to be less of a concern as fewer than 30% of respondents said they went without medicines or medical treatment several/many times over the past year (22.8% in Ruaraka and 28.8% in Seme).

Figure 3. Over the past year, have you or anyone in your family gone without medicines or medical treatment?

Fuel is also relatively scarce in Chipangali; 40% of respondents said they went without fuel to cook their food several/many times/always in the past year (Fig. 4). The same value is 30% in Mandevu while in Kenya fewer than 20% of respondents indicated they went without fuel (17.5% in Ruaraka and 13.9% in Seme).

Figure 4. Over the past year, have you or anyone in your family gone without fuel to cook your food?

Lack of a cash income is common in Chipangali and Seme; 76.4% and 72.7% of respondents said they have gone without a cash income several/many times/always over the past year in Chipangali and Seme, respectively. The same figure is 41.8% for Mandevu

Figure 5. Over the past year, have you or anyone in your family gone without a cash income?

Communications and media consumption

Mobile phones and the Internet

Mobile phone penetration in the two constituencies in Kenya is high, reaching nearly everyone. The majority of respondents answered "yes" to the question "Do you ever use a mobile phone?" in rural (97.3%) and urban (97.7%) constituencies surveyed. The high

level of access in the rural constituency in Kenya appears to be partially accounted for the phenomenon of shared phones, as 22.1% of the rural sample indicated that they share mobile phones (compared with 6.2% in the urban sample). Access to mobile phones in Kenya is nearly universal in the areas surveyed, and therefore not gendered, with 98.9% of men and 96.1% of women having ever used a mobile phone (Fig. 6).

In Zambia, mobile phone penetration is higher in the urban sample and among men. In response to the question “Do you ever use a mobile phone?”, 84.0% in the urban constituency answered “yes”, compared with 54.2% in the rural constituency. Sharing mobile phones is unusual among respondents in Zambia, with 6.6% in the rural and 3.0% in the urban constituencies indicating they use a mobile phone from a friend or family member. Unlike Kenya, access to mobile phones is gendered in Zambia, with 74.9% men using mobile phones as compared with 62.8% of women. This gender gap is larger in the rural constituency surveyed, in which 62.5% of men stated they had ever used a mobile phone, compared with 47.3% of women (Fig. 6). This difference is less marked in the urban constituency in Zambia, where 80% of women have access to mobile phones (compared with 89.5% of men).

In both countries, mobile phones are mainly used to make and receive calls, although texting is also common in Kenya. The majority of respondents who use mobile phones indicated that they talk on them for up to 30 minutes a day, both in Kenya (83.8%) and in Zambia (89.8%). In Kenya, 62% of respondents who use mobile phone send SMS, indicating they usually send 1-3 texts a day. Sending and receiving SMS is more common in urban areas (73.9% of urban-based mobile phone users use SMS), compared with rural areas (51.2% of rural-based mobile phone users use SMS), and also more common for men (66.7% mobile phone users who are male use SMS) than for women (58.9% of mobile phone users who are female use SMS).

In Zambia, fewer than half of respondents who have ever used mobile phones send and receive SMS (43.7%), with no significant differences between rural (42.5%) and urban areas (45.8%), or between male (46.0%) and female (41.3%) users. The most common reason given in Zambia for not using SMS is illiteracy/innumeracy among both urban (29%) and rural users (34%).

Figure 6. Do you ever use a mobile phone?

Internet reaches only a minority of the population in Kenya and Zambia, but the level of Internet use among respondents is higher in Kenya. When asked the question “Do you ever use internet?”, only 27.0% of respondents in Kenya and 12.9% in Zambia answered “yes”. However, there is a considerable urban/rural divide in both countries. In Kenya, 39.0% of those surveyed in the urban constituency had ever used the Internet. This figure drops to 14.7% in the rural constituency. The rural/urban divide is more marked in Zambia, with Internet use reaching 25.2% of the urban sample and only 2.0% of the rural. A greater number of men indicated they used the Internet compared with women both in Kenya (39% of men and 16.1% of women use the Internet) and in Zambia (16.7% of men and 9.1% of women). Internet is a male and urban dominated ICT across the four constituencies (Fig. 7).

Figure 7. Do you ever use the Internet?

In both countries, respondents most often accessed the Internet via mobile phones (80.5% of internet users in Kenya and 73.2% in Zambia), followed by personal computers (16.0% of internet users in Kenya and 16.8% in Zambia). In Kenya, people who use the Internet spend more time on it (55.5% spends more than 30 minutes a day) than in Zambia (43.6% spends more than 30 minutes a day). The most common use of the Internet indicated was social networking (72.5% of Internet users in Kenya and 69.2% of Internet users in Zambia), followed by email (42.0% of Internet users in Kenya and 29.2% of Internet users in Zambia), and by reading news and current affairs (25.9% of internet users in Kenya and 15.4% of internet users in Zambia). The main barrier to Internet use is illiteracy, both in Kenya (43.9%) and in Zambia (63.0%); although, in Kenya limited access (19.4%) and cost (15.8%) are also mentioned as barriers to use.

Radio, TV and newspapers

Radio listenership is very high in Kenya. Almost all respondents indicated they listen to the radio (98.4% in rural and 92.7% in urban constituencies). Listenership is also high in Zambia, but significantly higher in the urban constituency (89.2%) than in the rural constituency (77.6%). Radio listenership is not gendered in Kenya (95.0% men and 95.9% women listen to the radio) but it is in Zambia, where the percentage of men who listen to the radio (87.9%) is higher than the percentage of women (78.6%). Figure 8 presents the breakdown of radio listenership by gender and constituency.

In both countries people listen to the radio either on their own set (78.9% of radio listeners in Kenya and 71.5% of radio listeners in Zambia), or on a friend's/family radio (15.8% of radio listeners in Kenya and 22.7% radio listeners in Zambia). The pattern of radio listenership is similar across the samples, with the majority of respondents listening to the radio for at least one hour per day (75.5% in Kenya and 64.0% in Zambia).

Figure 8. Do you ever listen to the radio?

Television (TV) viewership is less common than radio listenership in both countries. In Kenya, while nearly all respondents listen to the radio (95.5%), only 65.0% indicated they watched TV. In Zambia, 83.0% of the samples listen to the radio, but only 54.3% watched TV. The difference in levels of TV viewership in Zambia compared with Kenya reflects differences between the rural areas in the two countries (rather than in the urban areas). In Kenya, 89.5% of the urban sample watch TV (versus 40.2% in the rural sample). The percentage of urban respondents in Zambia is similar (87.0%), but the percentage of rural respondents is much lower (24.6%). Unlike radio listenership, there is a gender gap in TV viewership in Kenya, in which more men (70.1%) watch than women (60.2%). In Zambia, there is no significant difference in TV viewership between men (55.6%) and women (53.1%). Figure 9 presents the breakdown by gender and constituency.

Figure 9. Do you ever watch TV?

Respondents who watch TV tend to watch more than one hour a day, both in Kenya (67.0%) and in Zambia (59.2%). In Zambia, respondents from urban and rural constituencies watch TV either on their own set (70.8% of those who watch), or on family members' and friends' TV sets (28.9% of those who watch). Similar practices were reported from respondents from urban constituencies in Kenya, where 70.4% of those who watch TV do so using their own set, and 26.9% watch on sets belonging to family and friends. In rural areas in Kenya, these figures are lower (38.3% own set and 36.2% at family and friends'), as it is also common (28.9% of those who watch) for respondents to watch TV in public venues such as community centres, cafes, shops and the workplace.

Reading newspapers is more common in Kenya than in Zambia. Also, in both countries it is more common in the urban constituencies and among men. In Kenya, 51.0% of respondents read newspapers at least once a month, while in Zambia this figure is only 29.3%. There is a significant urban/rural divide in both countries with more than half of the rural sample in Kenya (57.1% in rural versus 36.1% in urban areas) and in Zambia (78.8% in rural versus 55.5% in urban) rarely or never reading a newspaper. Readership of newspapers is markedly gendered, particularly in Zambia. In Kenya, 46% of women indicated they rarely or never read a newspaper (versus 32.4% men) while the same figure is 76.6% in Zambia (versus 58.4% men). Figure 10 presents the breakdown by gender and constituency.

Figure 10. Do you ever read a newspaper?

The high penetration of both radio and mobile phones in Kenya appears to offer supportive conditions for audience participation in radio shows, both in rural and urban areas. In Zambia, lower levels of mobile phone penetration may impact on participation in such shows although radio listenership is still high in the urban constituency. Conditions are not as favourable in the rural constituency in Zambia with moderate levels of radio listenership and mobile phone penetration (Fig. 11).

Figure 11. Penetration of radio and mobile phones in the four constituencies

Listenership and participation in interactive shows

Listenership to interactive shows

The question “Have you ever watched or listened to any shows on the radio or TV that allow you to contact them” reveals higher levels of listenership of interactive radio shows in the Kenyan sample (89.9%), compared with the Zambian sample (50.8%), among respondents who indicated they listen to the radio. A rural/urban divide is present only in Zambia where the percentage of respondents in the urban constituency who listen to interactive shows is higher (61.1%) than in the rural constituency (41.8%), among respondents who listen to the radio. In Kenya, listenership of interactive shows is higher in the rural (93.4% of those who ever listen to radio) than in the urban constituency (86.1% of those who listen to radio); however, this difference is not statistically significant. The pattern of listenership of interactive shows matches the pattern of general listenership of radio in these two countries (cf. Figs. 12 and 8).

Figure 12. Have you ever watched or listened to any shows on the radio or TV that allow you to contact them?

In Kenya, listenership of interactive radio shows is not gendered (90.9% of men and 89.9% of women who ever listen to radio), but it is in Zambia: looking among radio listeners, 59.2% of men and 43.4% of women listen to interactive radio shows. Figure 13 presents the breakdown by gender and constituency.

Figure 13. Listenership of interactive shows on the radio or TV per constituencies and gender

The levels of listenership of interactive radio shows do not differ substantially by the type of show. When the types of shows are grouped into politics and development, socio-cultural and entertainment (Table 1), the levels of listenership across these three broad categories of shows are very similar across all four constituencies: roughly 80-90% of people who listen to interactive radio shows in general. The only exception is the urban constituency in Zambia where listenership of shows on politics and developments is lower, comprising only 68.8% of those who listen to interactive shows.

Table 1. Types of shows and topics

Type of show	Topics
Politics and development	Politics, current affairs, agriculture and development
Socio-cultural	Religion, relationships, cultural, sports and women's issues
Entertainment	Music, competitions/quizzes, shopping

The gender analysis shows that men and women listen equally to all types of shows. There is only a slight tendency across all four constituencies for more men to listen to interactive shows in politics and development than women, but this is not statistically significant (on average, among listeners of interactive shows in politics and development, 52.2% are men and 49.4% are women). For the other types of interactive radio shows, there is an equal divide between men and women. The only exception worthy of note is a higher tendency for women (versus men) to listen to music shows in the urban constituency in Zambia.

Further analyses into these three broad types of shows find that respondents do not show a clear preference for one type of interactive radio show (cf. Fig. 14). In Kenya, 76.4% of listeners of interactive shows listen to all three types of shows (79.9% in the urban and 73.1% in the rural constituency), while in Zambia the equivalent figure is 73.1% (60.6% in the urban and 83.1% in the rural constituency).

Figure 14. Listenership of interactive shows per type of show, constituency and gender

Participation in interactive shows

In the Kenyan sample, while the majority of the respondents listen to interactive radio shows (89.9% of those who ever listen to the radio), only 22.4% of those who listen to interactive shows also answered “yes” to the question “Have you ever participated in a radio or TV show that allow you to contact them?”. In Zambia, while listenership of interactive shows is lower (50.8% of those who ever listen to the radio), the relative level of participation in the shows is actually higher than in Kenya (29.5% of those who ever listen to interactive shows).

Differences between rural and urban respondents in participation in interactive shows in both countries mirror patterns found in who listens to interactive shows and to radio in general (cf. Figs. 15, 12 and 8). In Kenya, there is no significant difference between rural (23.0% of those who ever listen to interactive shows) and urban (21.8% of those who ever listen to interactive shows) constituencies, while a greater percentage of listeners in urban areas participated in Zambia compared with rural areas. 34.2% of respondents from the urban constituency who had listened to interactive shows also participated in these shows, compared with 24.1% listeners of interactive shows from the rural constituency. Consideration of levels of participation and listenership in the two countries shows that participation in interactive shows in Zambia is proportionally higher than in Kenya. These findings suggest that in Zambia listeners tend to engage more in interactive shows than in Kenya, both in rural and urban areas, despite mobile phone access being less widespread than in Kenya.

Figure 15. Have you ever participated in a radio or TV show that allowed you to contact them?

Patterns in participation by men and women in interactive shows are similar in Kenya and in Zambia, with approximately 10% more men having participated than women in the overall sample. In Kenya, 27.2% of men and 17.9% of women who listen to interactive shows also indicated they had participated in these shows. In Zambia, 33.3% of men and 24.7% of women who listen to interactive shows had ever participated in these shows. The gap between men and women in terms of the percentage who had participated is wider in the rural constituency in Zambia, in which only 5% of women who listen to these shows had participated, compared with 17.6% of men (Fig. 16).

Figure 16. Have you ever participated in a radio or TV show that allowed you to contact them?

Although female respondents are not more likely to send SMS than men in general, slightly more women had texted in to interactive shows than men, both in Kenya (50.0% of women and 47.2% of men who had participated in these shows) and in Zambia (34.9% of women and 33.3% of men who had participated in these shows). However, these differences are not statistically significant.

Across countries and constituencies, participation mainly is through calling in (71.0% in Kenya and 71.6% in Zambia among those who had participated in interactive shows). This is particularly salient in the rural constituency in Zambia, in which nearly all the people who had participated in interactive shows did so through a phone call (95%) and SMS use is not very common (22.5%)². An exception is in the urban constituency in Kenya. Here, SMS is also common (among those who had participated in interactive shows, 64.7% called and 60.3% texted). Participation through SMS occurs more in urban areas, both in Kenya (60.3% of those who had participated from the urban versus 37.7% from the rural constituency) and in Zambia (42.0% of those who had participated from the urban versus 22.5% from the rural constituency).

Contrary to the uniform levels of listenership found across types of interactive shows, levels of listener engagement varies with the type of show, with remarkable specificities across sites. When grouped into politics and development (politics, current affairs, agriculture and development programmes), socio-cultural (religion, relationships, cultural, sports and women's programmes) and entertainment (music, competitions/quizzes, shopping programmes), the levels of participation are between 8.8% and 13.3% in Kenya, and 17.2% and 17.9% in Zambia, among the respondents who indicated they listened to these shows.

² The percentages do not sum to 100 because some people participated both through mobile phone and SMS.

In the two Kenyan constituencies, the highest level of participation is in entertainment shows (13.3%), followed by politics and development shows (11.4%), and socio-cultural shows (8.8%). In Zambia participation levels depend on the constituency: in the rural constituency, listeners more often participate in shows about politics and development (17.8%), followed by socio-cultural (15.1%) and entertainment shows (10.4%). In the urban constituency, listeners participate more in entertainment shows (22.6%), and then socio-cultural (20.1%) and politics and development shows (16.7%). These results suggest that participation in entertainment and socio-cultural shows in the urban constituency in Zambia might explain the relatively higher levels of participation in Zambia than in Kenya.

Participation in interactive shows does not only differ by the type of show, but is also associated with gender. In Kenya, more men participate in interactive shows than women, irrespective of the show or whether the respondent is in a rural or urban area. The difference between men and women is comparable for shows on politics and development and socio-cultural shows, but is narrower for entertainment shows. In Zambia, participation is only gendered for politics and development shows in both urban and rural areas.

In both countries, fewer women participate in shows on politics and development than men. In Kenya, 71.2% of radio listeners who had participated in politics and development shows are men, leaving only 28.8% women. In Zambia, the aggregated gender gap is similar, with men comprising 70.5% of those who had participated in politics and development shows, and only 29.5% women, but there were also particularities by constituency. In Kenya differences in men and women's participation in shows on politics and development extends to both urban (71.0% are men and 29.0% are women) and rural (71.4% are men and 28.6% are women) constituencies. However, in Zambia this gap is narrower in the urban constituency (61.9% are men and 38.1% are women), compared with the rural constituency (78.3% are men and 21.7% are women). Engagement of urban-based women in politics and development shows in Zambia is considerably higher than in the other three constituencies.

Differences in participation between men and women are not unique to politics and development shows in the Kenyan samples. A comparable gender gap was reported in socio-cultural shows (among those who had participated, 72.5% are men and 27.5% are women) in Kenya. The gender gap in socio-cultural shows is accentuated in the rural constituency in Kenya (among those who had participated, 80% are men and 20% are women), compared with the urban constituency (among those who had participated, 65.4% are men and 34.6% are women). The same difference holds for participation in entertainment shows (among those who had participated, 61.3% are men and 38.8% are women), generalisable for urban (among those who had participated, 65.4% are men and 34.6% are women) and rural areas (among those who had participated, 61.0% are men and 39.0% are women).

In Zambia, unlike Kenya, the gender gap in participation is specific to politics and development shows. The aggregated differences between men and women who had participated in socio-cultural shows (among those who had participated, 52.0% are men and 48.0% are women) and entertainment shows (among those who had participated, 52.9% are men and 47.1% are women) are not statistically significant. However, this aggregated picture does not hold when distinguishing between urban and rural constituencies. Participation is gendered in rural areas for all types of interactive shows. In the rural constituency in Kenya, more men participate in socio-cultural programmes than women (among those who had participated 57.9% are men and 42.1% are women). The same holds for participation in entertainment shows (among those who had participated, 64.2% are men and 35.7% are women). Surprisingly, in the urban constituency in Zambia, where the overall gender difference in participation is narrower than in the other sites, women participated slightly more in socio-cultural shows (among those who had participated, 48.4% are men and 51.5% are women) and entertainment shows (among those who had participated, 48.6% are men and 51.4% are women). However, these differences do not achieve the threshold for statistical significance.

Notwithstanding the finding that people who listen to interactive radio shows tend to listen to all types of shows, participation varies by type of show (Fig. 17). When the three categories of interactive shows are combined, only 29.5% of those who had participated in interactive shows in Kenya and 25.8% those of had participated in interactive shows in Zambia had participated in all three types of shows. Rather, participation appears segmented. In Kenya, 15.9% of those who participated in interactive shows only participated in politics and development shows, 12.5% in socio-cultural shows and 21.6% in entertainment shows. In Zambia, participation is divided relatively equally between the types of shows, with the same percentage of listeners having participated in politics and development shows and socio-cultural shows at 19.7% each, and 15.2% of respondents having participated in entertainment shows. There are some specificities by constituency. For example, in the rural constituency in Zambia, participation is mainly specialised in politics and development shows (28.1%) and in the urban constituency in Kenya there is greater specialisation of participation in entertainment shows (28.9%).

Figure 17. Participation of interactive shows per type of show, constituency and gender

There is an inverse effect of age on participation in both countries. A larger number of younger people (aged 18-34) engage in interactive shows in the rural constituency in Kenya (28.8% of those in the age group) and in the urban constituency in Zambia (25.7% of those in the age group) (Fig. 18). In contrast, in the urban constituency in Kenya, it is the older group (34 years and over) who participate more often in these shows (22.9% of those in the age group). There no significant differences by age in participation in the rural constituency in Zambia.

Figure 18. Listenership and participation of interactive shows per constituency and age

Income level tends to correlate with levels of participation in rural Kenya and urban Zambia (Fig. 19). Wealthier people tend to both listen and participate more in interactive shows. However, the relationship between income and participation is only linear in the rural constituency in Kenya and in the urban constituency in Zambia.

Figure 19. Participation of interactive shows per constituency and income

Education shows a consistent positive relationship with participation in interactive shows across the all sites (Fig. 20). In the rural constituency in Zambia, the percentage of people with lower levels of education (up to junior secondary school) that listen to interactive shows is higher than the percentage of people with higher levels of education (junior secondary school or higher) who listen to the shows. In contrast, 50% of listeners with higher levels of education had participated in the shows.

Figure 20. Participation of interactive shows per constituency and education

The profile of women who listen and who participate in interactive radio shows differs from the overall female population. Women who are younger and more educated are more likely to both listen and participate in interactive shows. Wealthier and single women are also more likely to participate.

Enablers and barriers to participation in interactive shows

The main reasons indicated by listeners as preventing them from engaging in interactive shows are cost (60.3% in Kenya and 52.5% in Zambia) and the expectation that they won't get through (33.5% in Kenya and 18.8% in Zambia). Cost was mentioned most often in all constituencies, but with a higher percentage in rural constituencies both in Kenya (62.5% in rural and 58.3% in urban) and in Zambia (65.6% in rural and 36.9% in urban). The second most common reason, the expectation that one will not get through, is more common in the urban constituencies in Kenya (29.1% in rural and 37.6% in urban) and Zambia (15.6% in rural and 22.5% in urban). Other reasons cited, such as lack of time, or concerns about criticism from others, anonymity/repression or inefficacy of the messages, were mentioned by less than 10% of the respondents in the four constituencies. There is no significant gender difference in the reasons for non-participation in interactive shows.

In all constituencies, most respondents indicated that they perceived presenters to be fair to all who participate (75.1% in Kenya and 77.1% in Zambia) (Fig. 21). However, when compared with rural respondents, respondents in urban constituencies are more likely to agree with the statement that presenters favour a particular group, particularly in Zambia (3.4% in rural and 24.5% in urban). In Kenya the difference is not statistically significant (18.1% in rural and 22.4% in urban).

Figure 21. Generally, do you think the presenters favour any type of people in the way they manage discussions?

More than half of the respondents in Kenya (51.5%) have a favourite talk show, more than in Zambia (42.1%). This also diverges between rural and urban areas. A greater proportion of urban respondents in Zambia indicate a favourite talk show (32.3% in rural and 53.2% in urban). There is no significant urban/rural difference in Kenya (53.2% in rural and 49.7% in urban).

Listeners tend not to identify the language of the broadcast as a barrier to participation. 74.4% of respondents in Kenya and 57.2% of respondents in Zambia answer “no” to the question, “If there were talk shows in a different language, do you think you would be more likely to participate?” Also, differences were not found between men and women, or between urban and rural areas across countries.

Respondents in Kenya explain reported lower levels of female participation in interactive shows, particularly in political/public affairs shows (Fig. 22), as tied to the discussion of topics that are not interesting to women (30.6% in rural and 37.2% in urban), low access to radio and mobile phones by women (16.9% in rural and 16.8% in urban), a lack of time (18.2% in rural and 12.0% in urban), and men discouraging women from participating (11.3% in rural and 11.0% in urban). One important gender difference in responses to this question in Kenya was the greater tendency for men to mention that one of the reasons why women don’t participate is because topics are not interesting to them (39.4% of women and 28.4% of men).

Figure 22. On some stations women don’t participate as much as men in interactive shows about current affairs and politics. Could you give TWO reasons why you think this is so?

In Zambia, 60% of respondents said that they don’t know (40%) or think there are other reasons for women not participating (20%) in politics and development shows. Among the reasons given, the ones more mentioned by respondents in Zambia were first, men in the community discourage women from participating (19.2% overall, 18.2% of men and 19.9% of women) and second, the topics discussed are not of much interest to women (16.4%). Similar to Kenya, the latter reason is mentioned by significantly more men than women (21.6% of women and 12.1% of men).

Perceptions of people who participate

The majority of respondents in Kenya (71.6%) and Zambia (84.2%) personally know someone in the community who has participated in interactive shows. Most respondents indicated they perceived people who participate are seen to speak for everyone in the community, both in Kenya (71.3%) and in Zambia (85.7%). Also, some respondents indicated they think that participants speak for themselves (23.6% in Kenya and 11.2% in Zambia).

Respondents perceive that those who participate in interactive shows are men (22.2% in Kenya and 16.1% in Zambia) with money (45.7% in Kenya and 43.3% in Zambia), time (35.9% in Kenya and 20.3% in Zambia) and education (14.5% in Kenya and 26.6% in Zambia). In Zambia respondents were more likely to also mention public skills, compared with Kenya (6.3% in Kenya and 13.6% in Zambia). In Kenya respondents also perceive participants to be younger (14.5% in Kenya and 4.4% in Zambia). There are no significant male/female or urban/rural differences in perceptions of who participate.

Impact of interactive shows

Across the four sites, the majority of respondents consider interactive shows to have a positive impact (Fig. 22), and only a minority (less than 5%) think that the impact is negative.

Figure 23. Overall, do you think that interactive talk shows have had a positive or negative impact on your community?

The majority of respondents in Kenya (82.9%) and Zambia (83.4%) indicated that they think interactive shows have a positive impact because people become educated (77.2% in Kenya and 48.4% in Zambia) and people can voice their concerns (37.7% in Kenya and 43.3% in Zambia). A minority of respondents indicated they think that shows impacts on those in authority by placing them under pressure to deliver what they promise or what they should provide (7.3% in Kenya and 10.8% in Zambia). When asked about the main negative side of talk shows, the greatest percentage of respondents said there were none (61.9% in Kenya and 40.3% in Zambia). Still, some respondents indicated they believe that interactive shows promote divisions within the country or community (14.2% in Kenya and 14.3% in Zambia).

Governance and accountability

In order to test the hypotheses that listenership and participation in interactive shows are related to participation in politics in general and to socio-political attitudes, the questionnaire included a section on governance and accountability. The descriptive results for these questions are presented in this section, with the aim to highlight differences between the four constituencies.

Survey results indicate that voter turnout in the last general election was higher in Kenya (82.6%) than in Zambia (58.9%). In Kenya there is no significant differences in the voter turnout between the rural (84.8%) and the urban constituencies (80.0%) (Fig. 24), and between men (83.8%) and women (81.1%). However, in Zambia significantly more respondents from the rural constituency (63.7%) voted in the last election compared with the urban constituency (53.7%), and more men voted (64.2%) than women (54.2%).

Figure 24. Did you vote at the last general election in 2013?

The main reasons given by respondents in Kenya for voting is leadership change (43.0%), electing a preferred candidate (13.4%) and exercising the right to vote (12.8%). The main reasons for not voting among respondents in Kenya are not having a valid ID (56.2%) or a voter's card/not registered as a voter (18.1%). In the rural constituency in Kenya, respondents mentioned not having an ID (65.3%) as a reason for not voting significantly more than in urban areas (48.2%). Both reasons for non-voting are mentioned by proportionately more women (60.3% not having an ID and 20.7% not registered as a voter) than men (51.1% not having an ID and 14.9% not registered as a voter). In Kenya, only 1.9% of respondents indicated not being interested as a reason for not voting, with no difference found between rural and urban constituencies. Only men indicated "no interest" as a reason for not voting in Kenya.

In Zambia, the reasons for voting are not having an ID (22.3%) or a voting card (22.8%), followed by a lack of interest (19.1%). The main reason for not voting in the urban constituency is "no interest in voting" (25.2%). The difference between rural and urban constituencies is significant, with fewer indicating this reason in the rural constituency (11.8%). More women (21.4%) than men (16.1%) also mentioned a lack of interest as the main reason for not voting in Zambia.

Many respondents in Kenya (41.4%) and in Zambia (61.2%) indicated they are not satisfied with the way that democracy works in their country. In Zambia dissatisfaction with democracy was voiced in both the urban (67.0%) and the rural constituencies (69.6%), and by both men and women (71.1% for men and 65.5% for women). In Kenya a higher percentage of respondents in the rural constituency (46.1%) said they were not satisfied with democracy compared with respondents in the urban constituency (36.9%) (Fig. 25). There is no significant difference between male and female respondents in the level of dissatisfaction with democracy (42.7% for men and 40.5% for women) in Zambia.

Figure 25. Overall, how satisfied are you with the way democracy works in Kenya/Zambia?

A much higher number of Kenyan respondents indicated they think it is more important to have governments accountable even if it means that the decision-making process is slower (65.2%) than Zambian respondents (32.1%). There is no significant difference between urban and rural areas, or men and women. However, a greater number of men in Kenya (67.1% for men and 63.5% for women) and women in Zambia (28.8% for men and 35.5% for women) tend to agree with this statement.

Kenyan respondents more often agree (73.2%) with the statement that news media are effective in revealing corruption compared with Zambian respondents (46.9%). These results are consistent across urban and rural constituencies (Fig. 26). However, more men in Kenya (74.5% for men and 71.9% for women) and women in Zambia (44.8% for men and 49.6% for women) tend to agree with this statement.

Figure 26. In this country, how effective is the news media in revealing government mistakes and corruption?

There is a clear distinction between the urban and rural constituencies in Kenya and Zambia in what respondents think are the most important issues that people face in the country. In the rural constituency in Kenya, the main issues identified were poor roads (19.9%) and shortage of water (19.9%) while in the urban constituency, insecurity (19.9%) and unemployment (19.9%) were identified first.

In the rural constituency in Zambia, the main problems indicated were farming (40.0%), water shortages (18.8%) and access to health (10.2%). In the urban constituency, the main problems were water shortages (28.7%), waste management (18.3%), poor roads (14.9%) and a lack of electricity (14.9%). These issues were mentioned equally by men and women.

In Kenya a greater number of respondents said they contact authorities (32.4%) and representatives (33.6%) than in Zambia (20.2% authorities and 28.3% representatives). In both countries, contacting public forums to draw attention to a problem is not as common (11.7% in Kenya and 11.3% in Zambia). Respondents are even less likely to contact a service provider (8.3% in Kenya and 7.3% in Zambia). There are some differences by constituency. In the urban constituency in Zambia only 9.2% of respondents have contacted an authority, compared with 30.2% in the rural constituency (Fig. 27-30).

Differences between men and women are very marked in both the frequency of contact and who is contacted. Overall, women from all constituencies contact these agents less often than men. The difference is most pronounced for service providers in both Kenya (of those who contacted, 63.9% are men and 36.1% are women) and Zambia (of those who contacted, 63.5% are men and 34.7% are women), as well as also representatives in Kenya (of those who contacted, 58.1% are men and 41.9% are women) and authorities in Zambia (of those who contacted, 61.3% are men and 38.7% are women). In Kenya 81.5% of the respondents indicated these contacts work fully or partially to resolve issues, while in Zambia 93.7% of respondents who tried to contact any of these agents feel the issue has not been resolved.

Figure 27. Have you ever tried doing any of the following things to raise ANY of your concerns? Contact authorities

Figure 28. Have you ever tried doing any of the following things to raise ANY of your concerns? Contact a representative

PiMA Working Papers

The **Centre of Governance and Human Rights (CGHR)**, launched in late 2009, draws together experts, practitioners and policymakers from the University of Cambridge and far beyond to think critically and innovatively about pressing governance and human rights issues throughout the world, with a special focus on Africa. The Centre aims to be a world-class interdisciplinary hub for fresh thinking, collaborative research and improving practice.
