Evolution of Research in Finance Over the Last Two Decades – A Topographical View

Abstract

A standard literature review focuses on the historical development of a particular topic. In contrast, the novel approach introduced in this study constructs a topographical map demarcating the relative importance, dispersion, and interrelationship among many finance topics. The final product is a bird's eye view of the whole literature illustrating historical trends, concentrations, and territories. We apply qualitative analysis, purposive sampling, and syntactic analysis to 34,261 articles published in 52 journals over the past two decades. First, we analyze the proliferation and historical development of topics. We find that a few topics (e.g., insurance) are losing ground to newer ones (e.g., blockchain and digital currency). Yet, several topics seem to occupy a stable, sizeable portion of finance literature (e.g., investment strategies and portfolio management). Next, we analyze the relationship between topics and journals and report strong tendencies that are not always confined by the traditional scope of journals. For instance, papers addressing investment strategy and portfolio management issues seem to appear in numerous journals; while special topics such as blockchain, digital currencies, dividends, and real estate can only be found in a limited number of journals. We also report strong interdependence among topics. More than a third of the papers screened in this study discusses two topics or more. We identify a list of topics that are likely to be investigated jointly. Overall, our work demonstrates the historical evolution of the entire finance literature; and identifies fertile areas for future research.

Key Words: Finance, Literature Review, Qualitative Analysis, Purposive Sampling, Topographical Map.

JEL Classification: C25, I22

Evolution of Research in Finance Over the Last Two Decades – A Topographical View

1. Introduction

Academic research in the field of finance is evolving with new topics emerging almost constantly. Journals, on the other hand, have increased in number and have recently become more liberal in defining their scope (Danielson and Heck, 2014). For instance, the most recent publications in the *Journal of Finance* focus on risk management while the most cited paper focuses on corporate bankruptcy predictions using financial ratios (Altman, 1968). Similarly, Andrikopoulou and Trichas (2018) explore patterns in publications in the *Journal of Corporate Finance* and report considerable variation in topics. Papers covering the issue of diversity and the environment have been receiving more attention in the *Journal of Banking and Finance*, which traditionally focuses on banking and financial institutions (Bennouri et al., 2018 and Zerbib, 2019). Further, several practical and theoretical considerations have caused research agendas to evolve in parallel, making the field more complex. Behavioral finance, for example, has evolved as a separate subfield without relinquishing its heritage as an extension of asset pricing models studies. This proliferation of interrelated topics combined with the increased complexity of journal-topic relationships calls for studies that depict the overall edifice of the field. This paper attempts to serve this purpose.

We observe increased interest in bibliometric literature reviews that portray the evolution of individual research agendas. Yet, we have very little research on how the whole finance literature has evolved. That is, numerous literature reviews address the historical development of individual topics, but we do not know much about the relative importance of topics or how they interrelate. Similarly, we have many papers that develop systems to rank journals, but we do not know how topics disperse over journals. In this paper, we develop a topographical map of literature that addresses these concerns. By definition, a topographical map of a region shows differences in

elevation and relative locations of landmarks. Analogically, a topographical map of the literature shows the concentration of topics across journals and time.

Using a sample of 34,664 papers published in 52 finance journals between 2000 and 2019, we apply qualitative analysis, non-probability purposive sampling, and syntactic analysis techniques to identify the routes that topics in finance have taken over the past two decades. Specifically, we apply purposive non-probability sampling to construct a sample that represents the literature without altering its structure. Next, we apply syntactic analysis (i.e., word parsing) to identify the content of papers in the sample. As a result, each article in the sample is represented by a vector of relative weights that capture the topics discussed in the article.

The topic-paper metrics are then aggregated into a three-dimension topographic map of the entire literature. The first axis depicts the historical development (i.e., time) and intersects a second axis concerning the dispersion of topics on journals. The interaction of these two axes reveals a journal-topic linkage that has often been ignored in the traditional bibliometric review process. Next, we look at the concentration of topics in the literature. That is, we introduce a third axis that captures the importance of each topic relative to other topics. The three sketches are then merged into a topographic map of finance literature. The final product is a web of threads and connections that portrays the dispersion of topics in the field.

Why is this important? Several rationales validate our exploration of the joint evolution of research topics in finance. First, we try to strike a balance between literature reviews and journal-ranking studies. We term this as a topographic map because it provides a bird's eye view of the field. Unlike literature review, which focuses on the theoretical and empirical developments of a certain topic and categorizes major findings, the objective of a topographic map is to show the joint development of *all* topics on a unified timeline. The emphasis is on the relative importance

of topics. Discussing the linkage between topics and publication outlets complements the sketch of the field. That is, unlike journal-ranking studies, which develop metrics to rank journals by their overall impacts (regardless of topic), the metrics used in this literature map captures the tendency of journals to publish papers on certain topics.

Second, researchers interested in understanding the current state of the field, or a certain topic therein, would benefit from a comprehensive map showing how various topics are positioned within the literature. Our holistic approach draws a topographical sketch that portrays overall developments, interrelationships, and concentrations (i.e., where certain subjects are likely to be found). This is analogical to navigating a diagrammatic map showing territories, landscapes, milestones and routes.

Furthermore, we refer to the journey of a doctoral student documented by Pansiri (2009) where the author highlights the difficulties to identify gaps in the literature. The sharp increase in the number of journals and the proliferation of topics and subtopics often exacerbates the difficulty for young researchers to identify viable areas of research. This brings us to the issue addressed by Baker and Pifer (2011). The World Economic Forum², concerning the 2019 OECD Education at glance statistics, identifies the United States as the highest producer of doctoral candidates. While such growth in Doctoral graduates is promising, less attention has been placed on the transition from dependence to independence among fresh doctoral graduates. We believe that our literature map would contribute to this transition and stimulate interest among early-career scholars in studying contemporary issues in finance.

² Please see the article titled “Which countries have the most doctoral graduates?” available at: <https://www.weforum.org/agenda/2019/10/doctoral-graduates-phd-tertiary-education/>

We report the evolution of 27 research topics in 52 journals in the form of a topographical map where mountains signify topics that have received greater interest and valleys represent topics that have received minimal interest over the past two decades. This way, we can identify overall trends where some topics (e.g., Banking and Investments) dominate research interests, others are being gradually pushed to the side (e.g., insurance), while others are gaining traction (e.g., Digital Currencies). More specifically, the most researched topics are Banking & Financial Institutions, Investment Strategies & Portfolio Management, and Capital Structure. These topics are also the major contributors to the overall growth of finance literature which is estimated at 4.03% per year. The least researched topics are Blockchain & Digital Currencies, Social Finance, and Islamic Finance. Nevertheless, these are the fast-growing topics (albeit their overall size is small, which explains why they do not contribute much to the overall growth of the literature). In 2000, the interest in Derivatives & Commodities, Market Microstructure, Capital Structure, Governance & Information Asymmetry, and Investment Strategies & Portfolio Management was the highest. Over the past two decades, we observe a relative increase in interest in Capital Structure, Governance & Information Asymmetry, and Investment Strategies & Portfolio while the relative interest in Derivatives & Commodities and Market Microstructure remained stable.

Next, we draw another topographical map that represents the frequency of journal-topic pairs in 2000-2019. Unlike the previous map, which focuses on historical trends, this one focused on the concentration of topics in journals. As such, a mountain represents an increased interest in publications related to a certain topic in a certain journal. A valley represents the opposite case. In a nutshell, this map helps researchers identify journals where certain topics are more likely to be found. It also shows which journals are more or less liberal in terms of accepting topics (we used the Herfindahl-Hirschman Index, HHI, to measure the overall concentration of topics in journals).

We report evidence that journals generally adhere to their advertised scope. To mention a few examples, Banking and Financial Institutions papers are more likely to be found in the Journal of Banking and Finance. Similarly, papers on Derivatives and Commodity are highlight concentrated in the Journal of Futures Markets. Nevertheless, we report evidence that journals do sometimes entertain topics outside their traditional scope and, accordingly, certain topics can be found in journals that researchers, especially younger ones, do not anticipate. For example, the Journal of Banking and Finance has accepted papers on Capital Structure, Investments & Portfolio Management, Market Microstructure, Econometrics, and Behavioral Finance. The most concentrated journals (i.e., they publish more papers on fewer topics) are the Journal of Risk and Insurance Corporate Governance and the Journal of Financial Econometrics. The least concentrated journals (i.e., their interests are broader) are the Pacific-Basin Finance Journal, European Financial Management, and International Review of Financial Analysis.

We also look at the dispersion of topics over journals. Unlike the previous exercise, which investigates the concentration of topics in each journal, this time we explore where (i.e., in what journals) each topic is likely to be found.

A low standard deviation indicates that the topic tends to be concentrated on a few journals, while a high standard deviation indicates that the topic is spread out over a wider range of journals. A low standard deviation indicates that the topic tends to be concentrated on a few journals, while a high standard deviation indicates that the topic is spread out over a wider range of journals. The smallest SD is associated with Blockchain & Digital Currency which is found in 14 journals; followed by Islamic Finance which can be found in 15 journals and Social Finance which is found in 25 journals. This is not surprising given the recency of these topics. The highest SD is associated with Econometrics and Behavioral Finance which are found in 51 journals (out of 52) and Banks

and Financial Institutions which is found in 50 journals (out of 52). This is quite expected given the popularity of these topics.

Finally, we document evidence of topic interdependence. That is, we show that certain topics are likely to be explored jointly with other topics. Overall, almost a quarter of all papers analyzed in this paper discuss two or more topics jointly. This trend seems to be stable over the past two decades with a very little year-to-year variation. The highest association is found between Capital Assets Pricing Models & Stock Behavior and Investment Strategies & Portfolio Management. About half of the papers that discuss Capital Asset Pricing Models & Stock Behavior discuss other topics such as Econometrics and International Finance. We also observe a strong association between Interest Rates & Bonds and Capital Structure, and between Small businesses & Entrepreneurship and Household Finance & Financial Planning. The least jointly-research topic is International Financial & Crises and Islamic Finance. Investments & Portfolio Management, Banks & Financial Institutions, Household Finance & Financial Planning, and Capital Structure are most likely to be discussed as the second topic.

Our work contributes to the literature as follows. This is the first study that portrays a topographical map of the extant literature of finance. This bird's eye view provides a holistic view of the field (as opposed to literature reviews that focus on individual topics) and reveals concentrations as well as journal-topic relationships. On the other hand, our work provides a topic-specific evaluation of journals (as opposed to traditional journal-ranking studies that focus on overall quality). As such, our work provides a finer metric that evaluates journals at the topic level. Further, our topographical literature map reveals a few trends such as the interdependence of topics. Finally, the paper discusses and applies a few methodologies that are not very common in finance; namely, qualitative analysis, non-probability purposive sampling, and syntactic analysis.

2. Paper Motivation and Review of Related Work

Journal-ranking studies are prevalent in finance literature. They are mainly concerned with the assessment of the quality and impact of finance journals (McNulty, and Boekeloo, 1999). The most applied metric of assessing journals' quality is several citations i.e., the average number of citations that a paper in the journal receives. Borokhovich, Bricker, and Simkins (1999) and Zivney and Reichstein (1994) apply citations score to assess the quality of finance journals. Chan, Folk, and Pan (2000) and Arnold, Butler, Crack, and Altintig (2003) use citation scores to assess the influence of financial research. Chung, Cox, and Mitchell (2001) analyze citation patterns in the finance literature. Nevertheless, several other metrics have been developed, such as the difficulty of publication (Beattie and Goodacre, 2006), library holdings or market-based studies (Borokhovich, Bricker, Zivney, Sundaram, 1995, and Bertin, Prather, and Zivney, 1994), experts' opinion or perception studies (Oltheten, Theoharakis, and Travlos, 2005; Borde, Cheney, and Madura, 1999), and authors' affiliation (Chen, and Huang, 2007).

The main objective of journal-ranking studies is to produce a metric that reflects the relative importance, or prestige, of journals. This is often used to assess faculty scholarly output in the promotion and tenure decisions; or to assess the reliability of findings (Zivney and Bertin, 1992). Alexander, and Mabry, 1994). Several authors have highlighted limitations that are inherent in all journal-ranking studies. To mentions a few, journal-ranking studies tend to be static and time-dependent (Kao, Hsu, Lu, Fung, 2016). Other limitations are dependence on citation as an indicator of influence, personal biases in perception studies and affiliation studies, and economic influences in library holdings studies (Beattie and Goodacre, 2006). In this study, we attempt to mitigate another limitation of journal-ranking studies. We posit that journal-ranking studies ignore topic-specific factors. Several journals are inherently focused on certain topics. For that reason,

the citations, personal opinions, or library acquisition decisions might be a function of the corresponding interest in the topic. For that reason, it would be interesting to develop a method that analyzes the journal-topic relationship.

Literature reviews, on the other hand, tackle topics, one at a time. A literature review study on a topic is more or less an integrative overview of the historical development of the topic under question. Literature review authors attempt to encapsulate in a single manuscript the current body of knowledge on the topic. To do so, they identify, appraise, critique, select and synthesize evidence and competing arguments relevant to the topic as depicted by previously published work in academic journals. Needless to say, literature reviews help a researcher who is interested in a particular topic. As such, they target scholars who presumably know what they are looking for. Literature reviews do not assess the importance of a topic and do not systematically explore its connection with other topics. As many authors have indicated, this is a real challenge because the literature has expanded rapidly and in a very complex fashion (see for example Danielson and Heck, 2014 and Zivney and Bertin, 1992). We need a tool that captures the complexity and diversity of all topics. Such a tool will give a bird's eye view of literature, portray dispersion of topics, and highlight journal-topic relationships. This is what we attempt to construct in this paper. We draw a topographical map of finance literature inclusive of all topics published in high-quality journals over the past two decades. Such a map will complement single-topic literature reviews. We believe that the map we produce would be ideally helpful to younger scholars who have not yet established themselves as experts in any particular sub-field of finance.

3. Methodology and Sample Construction

3.1 Sampling Technique

It is often problematic to select the best sampling method to answer research questions from a wide variety of available methods. Where do we start? How many journals to include? What would be considered good criteria to include/exclude journals? There are a plethora of journals that publish research articles in finance. Therefore, constructing a database that includes all journals that publish scholarly work in finance is inefficient and costly. A probability sampling technique, for example, the random sampling approach, is certainly the safest choice from a strictly statistical perspective. However, the objective of this research is not to generalize findings or draw conclusions based on conventional statistical inference. The goal here is to build a manageable sample that convincingly mimics the hierarchal structure of academic journals where impactful research is found. This necessity automatically rolls out the application of probability sampling in this study as it may inadvertently distort journals rankings. For instance, a purely random sampling procedure may exclude a highly influential journal (for example, *the Journal of Finance*).

Constructing a representative sample by hand is not a good alternative either; it raises concerns of subjectivity because it carries a risk of being biased by the researcher's views. For these reasons, we decided to consider a non-probability sampling method, which strikes a balance between pure randomness and researcher-imposed selection. Specifically, we found that non-probability purposive sampling is the best approach for this research.

Purposive sampling is applicable in situations where the researcher can obtain a better sample by using sound judgment than by using probability sampling. At the same time, purposive sampling preserves a certain level of randomness that preempt accusations of subjectivity and personal bias. More specifically, purposive sampling becomes particularly paradigmatic in certain

cases where the goal is to understand data, not to generalize the findings; and when a modest direction by the research is tolerable and desirable [please see Flick, 2013; Bell, Bryman, & Harley, 2019].

To summarize, we found that the non-probability, the purposive sampling method is most appropriate for our current inquiry because we need an efficient and manageable sample that meets two criteria. First, it does not exclude top-tier, well-known journals. Second, it convincingly represents the population of journals by including the majority of journals where the impactful finance articles are published.³

3.2 The Sample

We start with the Australian Business Deans Council (ABDC) Journal Quality List. The list is developed by expert panels which conduct an extensive review to assess journals quality and impact. The ABDC list is widely used by business schools. The 2019 List endorses 2,682 journal entries with the classifications shown in the table below.

[Insert Table 1 about here]

To emphasize quality, we keep A*- and A-level journals only. Eliminating B- and C-level journals reduces the sample size to 850 journals representing the upper 31.69% of all journals in the ABDC list. The remaining list of 850 journals includes numerous finance and non-finance journals. As we mentioned before, non-finance journals sometimes publish finance articles.

³ To illustrate, assume a hypothetical Business Dean who is evaluating the research output of a finance faculty for promotion or tenure considerations. He would want to build a purposive sample of finance journals. He should refrain from using a randomly selected sample of journals. Equally important, he should refrain from using a self-selected sample. Keeping in mind that the “purpose” of the sample is assessing how faculty’s research agenda stacks up against extant finance literature, he would need to construct a sample of journals that is 1) quality-driven, 2) reasonably comprehensive and 3) manageable. In other words, he would build a sample that serves a specific purpose, hence the name: purposive sampling.

However, in the interest of keeping the research focused, it is safe to consider these publications “isolated” incidents.⁴ Thus, we apply a second criterion. We require that the journal-title must include at least one keyword that indicates a finance journal.

The list of keywords is obtained by parsing lists of journals found in a few prominent journal ranking papers [Chen & Huang, 2009; Currie & Pandher, 2010; Danielson & Heck, 2014; Holden, 2017]. The list of keywords we use includes Finance, Financial, Financing, Investment, Investing, Portfolio, Wealth, Asset(s) Pricing, Money, Credit, Bank(s), Banking, Capital Market(s), Financial Market(s), Governance, Corporate, Derivatives, Futures, and Fixed Income. This exercise identifies 52 journals.⁵

For each journal in our sample, we collect key textual information including the title, year of publication, volume, authors, subjects (keywords), and abstracts for all volumes issued between 2000 and 2019. The result is 69,999 entries in 52 articles.

We only consider full studies; therefore, we exclude corrigenda, errata, issue information, editorial notes (and statements and introductions), comments and responses, reports to readers, obituaries, volume index, award announcements, symposium and conference and annual meetings

⁴ Excluding non-finance journals should not affect the quality of this paper. While a few good finance papers may exist outside the realm of finance journals, the bulk of mainstream finance literature would always reside inside the realm.

⁵ As a second ranking system, we use Scopus. Scopus is a large database of peer-reviewed journals, books and conference proceedings in many scientific fields. For each journal in the sample, we report its Scopus CiteScore and Percentile. CiteScore is calculated as citation count received in a certain year to documents published in the prior three years divided by the number of documents published in the prior three years. Formally,

$$\text{Cite Score} = \frac{\text{Citations in Year } T \text{ to Publications Years } T - 1, T - 2 \text{ and } T - 3}{\text{Number of Publications Years } T - 1, T - 2 \text{ and } T - 3}$$

At the time of constructing the sample for this paper, the available CiteScore used the 2018 citation count which was last updated in March 2020. In addition to CiteScore, the Scopus database reports a Percentile for each journal. Scopus and ABDC do not always produce consistent ranking. For instance, *The Journal of Finance* is classified as an A*-level journal in ABDC; its CiteScore is 10.3 which is the highest in our sample, and its percentile is 99%. In contrast, *The Journal of Financial Research* is classified as an A-level in ABDC; its CiteScore is 0.8 which is the lowest in our sample, and its percentile is 27%.

reports, call for papers, acknowledgements, policy notes, executive summaries, book reviews, fellowship announcements, miscellanea, table of contents, subscription pages, and repetitions. This reduces the sample size to 49,905 research articles. Finally, we require that the abstract is available, and the paper must have at least one citation by different authors (i.e., self-citation does not count). This reduces the sample size to 37,332 research articles published in 52 journals between 2019 and 2020.

3.3 Syntactic Analyses

We parse the textual information of all articles to depict the dispersion of topics over time and across journals. We use recent literature reviews to generate lists of keywords and terms that are indicative of a certain topic. Then, we run an algorithm that counts the frequency of these words in the title, subjects, and abstracts of each paper in the sample. We identify 27 different topics. As such, each paper is represented by a 1×27 row vector that signifies its content. Each item in the row vector represents the frequency of keywords and terms that pertain to a specific topic. To illustrate, we present an example.

Illustration – Tracing Merger and Acquisition Content

For each paper, we parse the title, keywords (subjects), and abstract to identify the frequency of the following words: merger(s), acquisition(s), diversification(s), target(s), acquirer(s), merge(s), merging, acquire(s), acquiring, consolidation(s), announcement return(s), divestiture(s), diversify(ies), takeover(s), multi-segment, and M&A(s). This list is generated from Guerras-Martín, Ronda-Pupo, Zúñiga-Vicente, Benito-Osorio (2020). They build a sample of 1,253 M&A articles over

the period 1970-2017 to analyze the evolution of corporate diversification literature.⁶

The frequencies of these keywords and terms are then summed into a score that represents the M&A content of the paper. To further illustrate, consider the following paper.

TITLE

Target's organizational form and returns to Australian bidders in cross-border acquisitions.

ABSTRACT

We present large-sample evidence on return performances of Australian acquirers who bid for public and private targets in cross-border acquisitions. While placing a particular emphasis on the method of payment and the shareholder protection offered by the target country, we analyze the impact of various bid, firm and foreign-acquisition-specific characteristics on bidding firms' abnormal returns. We find that Australian investors perceive cross-border acquisitions as value-creating exercises regardless of the organizational form of the target acquired. However, bidders for private targets earn a higher return when the method of payment is stock, and the targets are located in high investor protection countries. We further find that the abnormal returns are conditional to the relative size of the target, bid frequency, target country destination and the pre-acquisition financial performance of bidding firms.

SUBJECTS (KEYWORDS)

Organizational goals; Rate of return; Bidders; Consolidation & merger of corporations; Stockholders; Financial performance; Australia

⁶ Our algorithm recognizes variant forms of the key words and terms. For instance, our algorithm recognizes that diversify, diversifies, diversifier, diversifiers, refer to the same concept. Similarly, our algorithm distinguishes between “merging” and “emerging” and between “merge” and “emerge.” The words “emerging” and “emerge” are not indicative of an M&A content.

This article will be assigned a score of 17 on the merger and acquisition topic. 17 is computed as 2 (title) + 13 (abstract) + 2 (subject).

When the same procedure is repeated for all papers, we obtain a $1 \times 37,332$ column vector. Each item in this column vector represents the M&A score of the corresponding paper. A higher score indicates higher content of M&A and vice versa.⁷

We repeat the procedure explained above for all 27 topics. The result is a $37,332 \times 27$ matrix where the rows represent papers (denoted i where $i = 1, 2, \dots, 37,332$) and the columns represent topics (denoted j where $j = 1, 2, \dots, 27$). Each item is denoted $Score_{i,j}$ and represents the score of topic j in paper i . Scores are then converted into percentage of content as follows,

$$\%Content_{i,j} = \frac{Score_{i,j}}{\sum_{j=1}^{27} Score_{i,j}} \quad (1)$$

where, $\%Content_{i,j}$ is the percentage of the content of paper i that belongs to topic j .

The fact that we take relative, not absolute, count of keywords ensures consistency and accuracy. To illustrate, the paper mentioned above will not pass as an M&A paper as a result of the simple counting of 17 key M&A words. It will do so only if the M&A relative content (i.e., the weight of the 17 M&A words) is substantial relative to other topics. To illustrate, for the paper above $\%Content_{1884,M\&A} = 91\%$. This means that other keywords that signify non-M&A topics count for only 9%. This is predominantly an M&A paper.⁸

⁷ We did consider using JEL classification codes. This would have cut the sample size to less than 10% due to unavailability of data and the use of different coding systems. Furthermore, we believe that our syntactic technique is more powerful for two reasons. First, it uses titles, subjects, and abstracts, which are presumably more representative of the true content and scope of a paper. Second, and more importantly, our analysis captures the relative weight of each topic in the paper; JEL classification is binary.

⁸ The authors are aware of the existence of bibliometric analysis. The objective of bibliometrics is to construct a citation graph that depicts citations between documents in a certain topic. It does not measure the relative importance or weight of any particular topic. To illustrate, bibliometric analysis would reveal that document A has cited document

Furthermore, to increase the precision and accuracy of our analysis, we will only consider a paper-topic pair if %*Content* is 25% or more. That is, to associate a paper with a topic, we require that at least a quarter of all keywords in the title, keywords (subjects), and abstract is concentrated on that topic. Further, we consider a paper-topic pair only if the title, keywords (subjects), and abstract include more than three keywords related to the topic. That is, three occurrences, or less, of key terms, do not establish a connection between the paper and the topic. These two additional requirements ensure that the accidental appearance of keywords does not count. It also ensures that a paper is not linked to a topic unless there is a substantial discussion of the topic in the paper. If a paper is not linked to at least one topic, it is not considered and eliminated from further analysis. This requirement reduces the sample size to 34,261 papers (in 52 journals) covering 27 topics (a matrix of $34,261 \times 27$). In this final matrix, the rows represent papers (denoted i where $i=1,2, \dots 34,261$) and the columns represent topics (denoted j where $j=1,2, \dots 27$). It is noteworthy that the two additional requirements have reduced our sample size by 8.2% only. This is evidence that our procedure, overall, is reasonably accurate because 91.8% of the paper are linked to at least one topic. Table 2 shows the structure of the final sample.

[Insert Table 2 about here]

The numbers in Table 2 indicate that the sample is fairly balanced. Panel A shows that the oldest journal in the sample is Financial Analysts Journal (1945) and the newest is the Journal of Financial Reporting (2016). The Journal of Banking and Finance includes 11.09% of papers in the sample (3,799 papers) and the Journal of Financial Econometrics includes 0.02% of papers (7 papers). The number of A-level journals is 39 and the number of A*-level journals is 13. The

B which is also cited by document C. Syntactic analysis, in contrast, reveals the relative concentrations of various topics in documents A, B, and C.

numbers in the correlation matrix (Panel B) are quite expected. Older journals are associated with a greater Percentile ($Corr = -0.11$) and CiteScore ($Corr = -0.26$). The Percentile and the CiteScore are strongly positively correlated ($Corr = +0.76$). Panel C shows that an average journal in the sample has a Percentile of 73%, CiteScore of 3.1, and includes 1.92% of the papers in the sample.

The highest Scopus Percentile score is 99% (Journal of Finance – see panel A) and the lowest is 21% (Journal of Fixed Income). The highest CiteScore is 10.3 (Journal of Finance) and the lowest is 0.6 (Journal of Fixed Income). Panel D shows the distribution of several topics per paper. About 72.83% of the papers were matched with a single topic. Multi-topic classification is understandably less frequent with 25.19%, 1.98% of the papers linked to two and three topics; respectively. In theory, a paper can be linked to up to 4 topics (we require that at least 25% of keywords are associated with a single topic to establish a paper-topic relationship).

4. Results

3.1 Evolution of research on finance

This section provides an overall view of the development of topics in finance literature over time. As mentioned above, a paper is associated with a topic if, and only if, the number of keywords for that topic represents 25% or more of all keywords found in the title, subjects, and abstract of that paper. In Table 3, we split the sample by years and report the raw number of paper-topic pairs for each topic in each year

[Insert Table 3 about here]

The Table depicts the relative concentration of topics over time. The total number of paper-topic pairs is 40,229⁹. The most researched topic seems to be the Banking & Financial Institutions which appears in 4774 papers representing 11.87% of all papers examined. Next comes Investment Strategies & Portfolio Management (8.47%), followed by Capital Structure (7.61%). On the other hand, the least researched topics are Blockchain & Digital Currencies (0.18%) followed by Social Finance (0.19%) than Islamic Finance (0.26%). This finding is not quite surprising given the significance and legacy of these topics within the finance literature.

The second last row in Table 3 reports average (arithmetic) annual growth. Not surprisingly, newer and smaller topics witness greater average annual growth. For instance, the smallest topic, BlockChain and Digital Currencies (which appears in 0.18% of literature) is the fastest-growing topic at a rate of 153.19% per year. This finding is mathematically sound because a single paper on a relatively small topic represents a greater within-topic growth than a single paper in a larger topic. The sheer difference in the relative sizes of topics makes it hard to compare growth this way. For that reason, in the last row of Table 3, we report the contribution of each topic to the average (arithmetic) annual growth of the entire finance literature. The numbers show that the average annual growth of the finance literature is 4.03%. Interestingly, the contribution to literature growth is not a linear function of the size of topics. The following figure illustrates this fact.

[Insert Figure 1 about here]

Table 3 and Figure 1 shows that the largest contributors to the growth of finance literature are Capital Structure (0.42%), Investment Strategies & Management Portfolios (0.40%), and

⁹ It is quite expected that number of paper-topic pairs is greater than number of papers (34, 261) because a paper could be associated with more than one topic.

Banks & Financial Institutions (0.39%). On the other hand, the least contributors to the growth of finance literature are Interest Rate & Bonds (-0.08%), REIT & Real Estate (-0.01%), and Islamic Finance (0.03%).

3.2 Topographical Map of Finance Literature

Figure 2 below depicts the topography of finance literature during the last two decades. By definition, a topographical map of a territory is constructed with large-scale detail and a quantitative representation of the surface using contour lines that show the points of equal elevation. In our context, a topographical map represents the frequency of finance topics over the years 2000-2019. As such, a mountain signifies a topic that has received an increased interest by authors (in all journals). A valley represents the opposite case.

[Insert Figure 2 about here]

The topographical literature map depicted in figure 2 reveals the historical evolution of interest in various topics. The largest mountain is associated with Banking & Financial Institutions. This topic has historically attracted the most attention of scholars and this trend seems to continue in the recent past. The next highest mountain is associated with Investments Strategies & Portfolio Management. Like the previous topic, this one has attracted relatively more attention. The next two heights are associated with Capital Structure and Governance & Information Asymmetry. Both shows consistent growth over time and relative importance compared to other topics.

A few interesting trends are found. The interest in Derivatives & Commodities and Market Microstructure was comparable to the interest in Capital Structure, Governance & Information Asymmetry, and Investment Strategies & Portfolio Management in 2000. Over the past two decades, however, the interest in Derivatives & Commodity and Market Microstructure did not grow as fast. .

The map depicts a few valleys that deserve extra attention. Research on REIT & Real Estate and Small Businesses & Enterprises has been historically marginal and it does not seem to be gaining any momentum. Emerging fields such as Islamic finance, Environmental Finance, Social Finance, and BlockChain & Digital Currencies also occupy valleys, which indicates little interest. However, the interest in these fields is increasing (see Table 3 for exact growth rates). The interest in certain topics has been increasing remarkably. For instance, the interest in Blockchain & Digital Currency, albeit relatively small, started in 2016 and has been increasing significantly and relentlessly since then.

3.3 The Concentration of Topics in Journals

In this section, we analyze the distribution of 27 topics over 52 journals. To do so, we calculate the content share of each topic presented in each journal (in all years 2000-2019). That is, we split the sample by journals and observe the concentration of topics. For each journal, we report the number of paper-topic pairs for each topic. The result is a 1×27 vector where each item represents the number of papers related to the corresponding topic published in the journal between 2000 and 2019. We do the same for all journals to obtain a 52×27 matrix. This matrix depicts the topography of finance literature during the last two decades and focuses on the journal-topic relationship. See Figure 3 below. Unlike the previous map in Figure 2, this topographical map represents the frequency of journal-topic pairs in 2000-2019. As such, a mountain represents an increased interest in publications related to a certain topic in a certain journal. A valley represents the opposite case.

[Insert Figure 3 about here]

The highest frequency observed is 1109 papers in Banks & Financial Institutions published in the *Journal of Banking and Finance* (JBF). Next comes 760 papers on Banks & Financial

Institutions published in the *Journal of Money, Credit and Banking* (JMCB). Next comes 707 articles on International Finance & Financial Crises published in the *Journal of International Money and Finance* (JIMF). Other high mountains include 577 articles on Governance, Agency, & Information Asymmetry published in *Corporate Governance*; 544 articles on Insurance in the *Journal of Risk and Insurance*; 520 articles on Derivatives & Commodity published in the *Journal of Futures Market*. We believe that this distribution of journal topics is quite reasonable given the traditional focus of these journals. In the subsequent section, we look deeper into this issue.

The numbers presented in Figure 3 above helps researchers identify journals where articles on certain topics are more likely to be found. Nevertheless, the numbers in Figure 3 cannot be used to judge journals interests in topics because some journals publish more articles. For that reason, we look at percentages. For each journal, we report the number of paper-topic pairs for each topic as a percentage of all paper-topic pairs in that journal. The result is a 1×27 vector where each item represents the content share of the corresponding topic in the journal. We repeat the procedure for 52 journals to obtain a 52×27 topographical map that shows the concentration of topics in journals. Results are shown in Figure 4 below.

[Insert Figure 4 about here]

The sum of all content shares for each journal is 100%. The highest concentrations are found in the *Journal of Risk and Insurance* (63.92% of articles are on Insurance); *Corporate Governance* (62.72% of articles are on Governance, Agency, & Information Asymmetry); *Journal of Financial Econometrics* (60% of articles are on econometrics). Again, were believe that these concentrations are quite expected given the traditional interest in journals. The findings in Figures 3 and 4 motivate our subsequent analysis. We ask questions like: besides the traditional interests

of journals, are there any secondary interests? Similarly, we explore where topics can be found in journals other than traditional targets?

3.4 The Concentration of Topics in Journals – A Closer Look

In this section, we delve deeper into concentrations and Journal-topic relationships. We use the content shares to compute the Herfindahl-Hirschman Index (HHI) which measures the overall concentration of topics in journals. It is calculated by squaring the content shares of all topics presented in a journal and then summing the resulting numbers. By construction, HHI ranges from close to zero (least concentrated) to 10,000 (most concentrated). Results are reported in the table below. In the interest of space and clarity, we present the top five topics for each journal only. The rest of the results is available upon request from the authors.

[Insert Table 4 about here]

The most concentrated journal is the Journal of Financial Econometrics (HHI = 4,400). This is quite expected given the highly focused scope of the journal. This is further affirmed by the relative importance of topics in the journal. 60% of articles are paired with Econometrics. The next popular topics in that journal are M&A & Diversification (20%) and Capital Asset Pricing Models & Stock Behavior (20%). The next journal on the list of concentrations is the Journal of Risk & Insurance (HHI=4,269). Again, this is quite expected given the focused scope of the journal. Not surprisingly, the most popular topic is Insurance (63.92%). Next comes Corporate Governance (HHI=4,042) with Governance, Agency, & Information Asymmetry being the most popular topic (62.72%). The fourth is the Journal of World Investment and Trade (HHI = 3,292) and the most popular topic is international finance and financial crises (49.65%). The fifth is the Journal of Futures Markets (HHI = 2,912) where the most popular topic is derivatives and commodities (50.63%).

The least concentrated journal is the Pacific-Basin Finance Journal (HHI = 605). The relative importance of topics in the journal is quite low. 11.28% of articles are paired with the Investments & Portfolio Management, 9.89% with Governance, Agency, & Information Asymmetry, 8.18% with Banks & Financial Institutions. The next least concentrated journals are the European Financial Management (HHI=608) International Review of Financial Analysis (HHI = 645).

A few secondary observations are worth mentioning. The highest journal-topic concentration is found in the Journal of Risk and Insurance - Insurance is the most popular topic occupying (63.92%) of the first topic spot. The second concentration is found in Corporate Governance where the topic of Governance, Agency & Information Asymmetry occupies the first topic spot with 62.72%. Similarly, 60.00% of the articles in the Journal of Financial Econometrics discuss econometrics. This finding confirms an earlier finding in this paper and is also supported by subsequent analysis. Specialized journals do live up to their expectation.

3.5 Dispersion of Topics over Journals

This section looks at the topic-journal relationship from a different angle. This section attempts to show where (i.e., in which journals) a certain topic is more likely to be found. To find out, we split the sample by topics (not journals as in the previous section) and report the number of paper-topic pairs for each topic as a percentage of all paper-topic pairs in each journal (not in each topic). The result for each topic is a 1×52 vector. Each element in the vector represents the content share of that topic in the corresponding journal (like in the previous section).

However, the content shares in a vector will not add up to 100% and, thus, Herfindahl-Hirschman Index (HHI) is not applicable. This is not by a chance; this section investigates what journals are more inclined to publish certain topics. As such, it is quite expected that certain

popular topics (e.g., Investment Strategy & Portfolio Management) will occupy sizeable portions in many journals while newer topics (e.g., Blockchain & Digital Currencies) will occupy smaller portions in a few journals. For that reason, we report another metric that captures the dispersion of topics, namely: standard deviation (SD) of content shares. For each topic, the standard deviation is computed with that topic shares in all journals.

A low standard deviation indicates that the topic tends to be concentrated on a few journals, while a high standard deviation indicates that the topic is spread out over a wider range of journals. Furthermore, we report the count of journals where the topic is found; we call this number J . Results are reported in the table below. In the interest of space and clarity, we present the top five journals for each topic only. The rest of the results is available upon request from the authors.

[Insert Table 5 about here]

The smallest SD is associated with the Blockchain & Digital Currency (SD=0.43% and $J_s=14$). This is not surprising given the recency of the topic and earlier findings of this paper. It occupies 2.74% of papers in the Finance Research Letters, 1.18% in the International Review of Financial Analysis, 0.71% in the Journal of World Investment and Trade, 0.54% in the Journal of International Financial Markets, Institutions & Money, and 0.39% in the International Review of Finance. Next comes the topic of Islamic finance (SD=0.78% and $J_s=15$). It occupies 5.26% of the Pacific-Basin Finance Journal, 1.82% of the Journal of International Financial Markets, Institutions & Money, 1.03% of the Global Finance Journal, 0.81% of the Journal of Financial Services Research, and 0.39% of the International Review of Finance. The third, fourth, and fifth spots go to Social Finance (SD=0.78% and $J_s=25$), REIT and real estate (SD=3.75% and $J_s=38$), and small business and entrepreneurship (SD=0.89% and $J_s=39$).

The highest SD is associated with econometrics (SD=9.70% and Js=51). This is quite expected given the popularity of the topic (see earlier findings in this paper). This topic occupies 60.00% of the Journal of Financial Econometrics, 29.89% of the Mathematical Finance, 26.47% of the Finance & Stochastics, 24.25% of the Quantitative Finance, and 17.38% of the Review of Income & Wealth. Behavioural Finance comes next (SD=6.97% and Js=51). It occupies sizable portions of the Journal of Behavioral and Experimental Finance (44.83%), Journal of Behavioral Finance (27.78%), Journal of Financial Markets (8.62%), International Journal of Managerial Finance (6.02%), and Review of Finance (4.48%). The third, fourth, and fifth topics are Banks & Financial Institutions (SD=11.74% and Js=50), Household/Personal Finance & Financial Planning (SD=5.16% and Js=50), and capital structure (SD=5.06% and Js=50).

3.6 Association of Topics

This section explores the association between topics. The question here is: what topics are more likely to be explored jointly in a single article? Mathematically, we compute the probability of linking a paper to a certain topic Y given that it is already linked to another topic X . Formally, we compute

$$PrX|Y = \frac{\# \text{ of papers that discuss } X \text{ and } Y}{\# \text{ of papers that discuss } X} \quad (2)$$

$PrX|Y$ is the likelihood of finding topics X and Y in all papers that discuss topic X . To illustrate, $Pr M\&A|Governance = 10.3\%$ mean that 10.3% of papers that discuss governance also discuss M&A. By construction, $PrX|Y$ ranges from zero (no association) to 1 (perfect association). Results are reported in the table below. In the interest of space and clarity, we present the top five associated topics only. The rest of the results is available upon request from the author.

[Insert Table 6 About Here]

Panel A shows that almost a quarter (25.19%) of papers analyzed in this research discuss two topics and about 2% discuss three topics. None of the papers in the sample was linked to more than three topics. Almost three quarters (72.83%) of papers were linked to a single topic. This trend seems to be stable over years with a very little year-to-year variation.

Panel B shows that there is a stronger association between certain topics. That is, certain topics are more likely to be investigated jointly in a single article. For instance, the highest association is between Capital Assets Pricing Models & Stock Behavior and Investment Strategies & Portfolio Management. Specifically, 30.95% of papers that discuss Capital Asset Pricing Models & Stock Behavior also discuss Investment Strategies & Portfolio Management. Capital Asset Pricing Models & Stock Behavior report the highest likelihoods of being discussed with another topic. . 16.47% of papers that discuss Capital Asset Pricing Models & Stock Behavior also discuss Econometrics. 5.94% of papers that discuss Capital Asset Pricing Models & Stock Behavior also discuss International Finance. This finding is explained by the obvious link between these topics and the prevalence of Asset Pricing Models & Stock Behavior studies. Next comes Interest Rates & Bonds; which is strongly associated with Capital Structure (25.78%) and Financial Accounting which is strongly associated with Firm Performance And Valuation (25.25%). We also observe a strong association between Small businesses & Entrepreneurship and Household Finance & Financial Planning (24.12%). Again, the obvious theoretical links between this topic explain these findings.

The least jointly-research topics are International Financial & Crises and Banks & Financial Institutions with the former being a topic that is least associated with other topics. Specifically, 1.08% of papers that discuss International Finance & Crises also discuss Banks & Financial Institutions; 0.54% discuss Econometrics & Methods, 0.38% also discuss Capital

Structure ... etc. Put differently, more than 96% of papers that discuss International Finance & Crises do not discuss any other topics. The next least jointly researched topic is Islamic Finance. Less than 10% of papers that discuss Islamic Finance discuss any other topic.

5. Investments & Portfolio Management is the topic that is most likely to be discussed with other topics. Looking at the second column of Panel B, this topic appears in 6 other topics as the first most co-researched topic. Next comes Banks & Financial Institutions (4), then Household Finance & Financial Planning (3) and Capital Structure (3). Given the prevalence of these topics (see earlier findings) it is not surprising that they are more likely to be jointly discussed. Conclusion

The objective of this topographical literature map is neither to sort out findings in a particular topic (as in literature reviews), nor it is to assess journals' impact or quality (as in journal-ranking studies). A literature review focuses on the historical development of a certain topic, summarizes major findings, contrasts methodologies, and otherwise portray the theoretical evolution of the body of knowledge the pertain to that topic in particular. Journal-ranking research attempts to sort journals by their overall influence regardless of topic. It would typically address the journal ability to drive discussions or invite citations in all topics. Both literature reviews and journal ranking research are unable to answer questions such as: what is the relative prominence of various topics in finance? Is there an interrelation between topics over time and across journals? What journals are more likely to publish certain topics?

Therefore, we developed a methodology to portray a topographical literature map. We employ the purposive sampling approach which is a well-known non-probability sampling technique in qualitative research. Qualitative research, by construction, adopts an inductive view of the relationship between concepts and data. That is, concepts emerge from data (unlike quantitative analysis where data is used to verify hypotheses). We then apply syntactic analysis to identify the

content of 34,261 papers published in 52 journals over the past two decades. The syntactic analysis goes beyond bibliometric analysis (which focuses on citations among documents) and focuses on the content and reveals the relative concentration of topics inside documents.

A bird's eye view literature map is portrayed as follows. A timeline depicts the distribution of publications in each topic over time. The second axis represents the distribution of publications in each topic across journals. The third axis captures the relative distribution of topics over time and across journals. The final product is a web of threads and connections that portrays the dispersion of all topics in the field.

Our study highlights several shifts in research interest among finance researchers. In the past, finance research was dominated by traditional topics such as Capital Structure, Banks & Financial Institutions, Investment & Portfolio Management which focus primarily on the corporate finance and financial markets. However, the latest innovations in financial markets in terms of products and technology has shifted research attention, rather modestly, to explore contemporary issues, such as Cryptocurrency, Social Finance, and Islamic Finance. Our study finds that these topics are the fastest growing in finance literature despite their relatively small size. Furthermore, the topographical map allows exploring further issues like the association between topics and journals and amongst topics. We report evidence that journals are generally becoming more liberal in defining their scope and almost a quarter of papers analyzed discuss more than one topic. Finally, we report strong interdependency between topics. For instance, almost half of Capital Asset Pricing Models papers also discuss another topic. Nevertheless, there are a few topics, such as Insurance and Derivatives & Commodities, that seem to remain rather secluded and restricted to fewer journals

The methodology we present in this study applies a combination of techniques and methods that are new to literature review studies. We strike a balance between traditional literature reviews and journal-ranking studies. Then we add an analysis of historical interrelation among various topics in finance and dispersion of topics over journals. We hope that our work will pave the road for similar work that explores unvisited territories and sheds more light on literature structure and evolution.

Appendix A – Topics and Indicative Words

The table below shows the 27 topics and areas screened in this literature map. It also shows the corresponding keywords. Our algorithm recognizes variants of the same words. For example, it recognizes verb forms (e.g., diversify, diversifies, diversifying, and diversified), plural and singular forms (e.g., merger and mergers; analysis and analyses), capital vs. small letters (e.g., Debt and debt), noun vs. adjective (e.g., statistics and statistical), abbreviations (e.g. DPS and dividend per share), and other variants of the same word (e.g., over-perform and overperform; method and methodology; behavior and behaviour). It also recognizes potential misspecification attributed to word similarity. For example, it won't count emerging as merging, and it won't count rational as ratio... etc.

No	Abbreviation	Topic/Area	Key words
1	M&A	M&A and Diversification	acquisition, target, acquire, merge, merger, consolidate, consolidation takeover, divestiture, diversify, segment, hostile, M&A, tender offer.
2	C.S.	Capital structure	debt, leverage, equity, capital structure, credit, bond, Modigliani, borrow, cost of capital, ownership, pecking order, trade-off theory, capitalization.
3	FPV	Firm Performance \$ Valuation	firm value, enterprise value, cash flow, firm performance, WACC, cost of capital, earning, forecast, valuation, ROE, return on, ash flow, ROA, market cap, EBITDA, PE, P/E, ratio analyses.
4	Div	Dividends	dividend, payout, retained earnings, shareholders, stockholders, record date, ex-date, capital gain, DPS.
5	Inv	Investment Strategies, Portfolio Management	stock return, stock performance, stock price, investment strategy, portfolio, underperform, overperform, benchmark, analyst, sentiment, momentum, volatility, transaction cost, Sharpe ratio, allocation, timing, simulation, liquidity.
6	Fund	Mutual & Hedge Funds	fund, hedge fund, mutual fund, ETF, fund performance, fund management, exchange traded, fund return, money management, prospectus, net asset value, expense ratio, 12b-1.
7	Micro	Market Microstructure	market microstructure, bid, ask, bid-ask, spread, volume, volatility, liquidity, orders, trader, quote, price format, price discovery, broker
8	Real	REIT & real estate	REIT, real estate, property, investment trust, residential, commercial, rental, lease, facilities, office build, tenant.
9	Int	Interest Rates & Bonds	interest rate, duration, term-structure, term structure, discount rate, bond, debt securitization, yield, maturity, issuer, principal.
10	Gov	Governance, agency, & information asymmetry	governance, board, BOD, agency, monitor, asymmetry, fringe, CEO, director, disclosure, control, Sarbanes-Oxley, conflict of interest, compensation.
11	Reg	Government & Regulations	government, regulate, IRS, authority, welfare, bankrupt, SEC, financial statements, reporting, authority, fraud, Act, politic, guideline, FED
12	Insu	Insurance	insurance, health, overage, medical, commission, insured, liability, deductible
13	Drv	Derivatives, Commodities, & Alternative Investments	derivative, option, futures, commodity, alternative investment, precious metal, Scholes, strike, speculate, expire, underlying
14	CAPM	Capital Asset Pricing Models & stock behavior	pricing model, CAPM, share price, Fama, factor, momentum, beta, alpha, loading, liquidity, volatility, anomaly, risk premium, equilibrium
15	Hous	Household & personal finance & Financial Planning	household, personal, budget, planning, retirement, pension, family, advisor, bankruptcy, fiduciary, consumer, social security, children, health, saving
16	Econ	Econometrics & Methods	econometrics, athematic, quantitative, qualitative, modeling, probability, estimation, statistics, inference, predictive, method, empirical, stochastic.

17	Beh	Behavioral Finance	behavior, rational, efficiency, confidence, bias, underreact, overreact, personal, psychology, anomaly, experiment.

27	Isl	Islamic Finance	Islam, sukuk, Islamic, Sharia, Quran, Muslim, Murabaha, Musharaka, Istinsna, Ijarah, Takaful

Table 1 – 2019 ABDC Journal Quality Classifications

In order to build a consolidated topographical map of finance literature, we need a manageable sample that convincingly mimics the hierarchal structure of academic journals where impactful research is found. Specifically, we need a sample that includes the majority of journals where the impactful finance articles are published. We start with the 2019 Australian Business Deans Council (ABDC) Journal Quality List which endorses 2,682 journal entries of various quality. We keep top 850 A*- and A-level journals only. Then we require that the journal title must include at least one key word that indicates a finance journal. This exercise identifies 52 journals as shown in Table 2.

Classification	Number of Journals	%
A*	199	7.42%
A	651	24.27%
B	850	31.69%
C	982	36.62%
Total	2,682	100%

Table 2 – Sample (2000–2019)

This table shows the structure of the final sample. We apply a non-probability purposive sampling technique. We use the 2019 ABDC Journal Quality List to select journals of A* and A quality. Then, we identify a list of 52 journals where the majority of impactful finance articles are published. Then, we use syntactic analysis to analyze the content of papers. That is, for each journal in the sample, we collect key textual information including the title, year of publication, volume, authors, subjects (key words), and abstracts for all volumes issued between 2000 and 2019. We apply several filters (explained in the main text). The final sample includes 34,261 papers published between 2000 and 2019 in 52 top quality finance journals. We parse the textual information (title, abstract, and subjects) of all articles to identify content. We identify 27 different topics; then, each paper is represented by a 1×27 row vector that signifies its content. The procedure is repeated for all papers to obtain a $34,261 \times 27$ matrix (see main text). In this matrix, the rows represent papers (denoted i were $i = 1, 2, \dots, 34,261$) and the columns represent topics (denoted j were $j = 1, 2, \dots, 27$). Panel A shows a list of all journals as well as their ABDC ranking and Scopus ranking. Journals are ordered by year of inception then alphabetically. Panel B reports correlation and Panel C shows key statistics. Panel D demonstrates the fact that sometimes a single paper may address several topics.

Table 3 – Historical Trends - Distribution (#) of Paper-topic Pairs Over Years (2000-2019)

The final sample is structured into a 34,261 × 27 matrix (see Table 2). In this matrix, the rows represent papers (denoted i were $i = 1, 2, \dots, 34,261$) and the columns represent topics (denoted j were $j = 1, 2, \dots, 27$). Each item is denoted $Score_{i,j}$ and represents the score of topic j in paper i . Scores are then converted into percentage of content as follows, $\%Content_{i,j} = \frac{Score_{i,j}}{\sum_{j=1}^{27} Score_{i,j}}$ were $\%Content_{i,j}$ is the percentage of the content of paper i that belongs to topic j . To increase the precision and accuracy we only consider a paper-topic pair if $\%Content$ is 25% or more. Further, we consider a paper-topic pair only if the title, keywords (subjects), and abstract include more than three key words related to the topic. We split the sample by years and report the raw number of paper-topic pairs for each topic in each year.

Finance Literature Map - Journal-Topic Relationship

Finance Literature Map - Journal-Topic Relationship

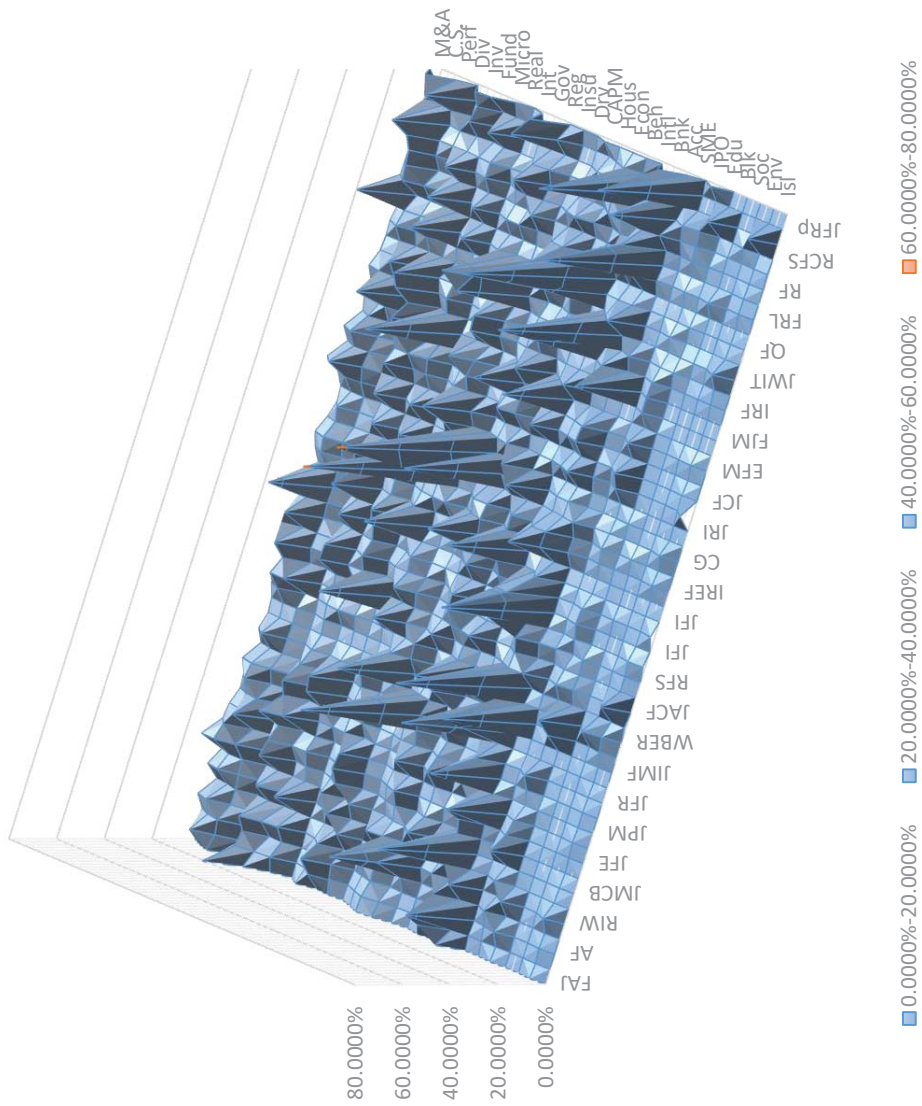

Table 4 – Concentration of Topics in Journals (2000-2019)

As in Table 2, journals are ordered by year of inception then alphabetically. The table shows the HHI index which represents the concentration of topics in each journal. We report the top five topics for each journal. The rest of findings are available upon request from authors.

Journal	HHI	Topic 1	Topic 2	Topic 3	Topic 4	Topic 5
		%	%	%	%	%
1 Financial Analysts Journal	900	Investment Strategies & Portfolio Management	Mutual and Hedge Funds	Firm Performance and Valuation	Financial Accounting	Capital Asset Pricing Models & Stock Behavior
		21.36%	9.95%	8.50%	7.28%	7.16%
2 Journal of Finance	691	Capital Structure	Banks and Financial Institutions	Investment Strategies & Portfolio Management	Mutual and Hedge Funds	Firm Performance and Valuation
		11.84%	11.23%	9.86%	7.13%	6.83%
3 Accounting & Finance	998	Financial Accounting	Governance, Agency, & Information Asymmetry	Investment Strategies & Portfolio Management	Firm Performance and Valuation	Capital Structure
		23.68%	11.94%	8.36%	7.76%	6.17%
4 Journal of Financial and Quantitative Analysis	664	Investment Strategies & Portfolio Management	Capital Structure	Banks and Financial Institutions	Mutual and Hedge Funds	Market Microstructure
		11.95%	9.01%	8.60%	8.18%	6.92%
5 Review of Income & Wealth	1569	Household/Personal Finance & Financial Planning	Econometrics	Financial Accounting	Government and Regulations	International Finance and Financial Crises
		31.96%	17.38%	9.43%	6.33%	5.60%
6 Financial Review (US)	655	Market Microstructure	Investment Strategies & Portfolio Management	Capital Structure	Banks and Financial Institutions	Governance, Agency, & Information Asymmetry
		12.31%	8.79%	8.29%	7.79%	7.29%
7 Journal of Money, Credit and Banking	1788	Banks and Financial Institutions	International Finance and Financial Crises	Econometrics	Interest Rates & Bonds	Capital Structure
		37.70%	11.41%	8.53%	5.80%	5.41%
8 Financial Management	860	Capital Structure	M&A and Diversification	Investment Strategies & Portfolio Management	Firm Performance and Valuation	IPO, Stock Issuance & listing, and Delisting
		13.71%	13.14%	11.43%	10.29%	9.14%
9 Journal of Financial Economics	656	Capital Structure	Governance, Agency, & Information Asymmetry	Investment Strategies & Portfolio Management	Banks and Financial Institutions	Capital Asset Pricing Models & Stock Behavior
		11.56%	10.60%	9.69%	7.74%	7.13%

10	Journal of Business Finance & Accounting	984	Financial Accounting	20.72%	Firm Performance and Valuation	15.34%	Governance, Agency, & Information Asymmetry	9.66%	Investment Strategies & Portfolio Management	7.24%	Capital Structure	6.93%

Table 6 – Association between Topics

This Table shows the association between topics i.e., topics that are likely to be explored jointly in a single article. Mathematically, we compute the conditional probability of finding topic Y in papers that discuss topic X as $PrX|Y = \frac{\# \text{ of papers that discuss } X \text{ and } Y}{\# \text{ of papers that discuss } Y}$. By construction, $PrX|Y$ ranges from 0 (no association) to 1 (perfect association). In Panel A we report the overall likelihoods of observing single, two, and three topics in the same article. In Panel B, we report the conditional probabilities $PrX|Y$ for pairs of topics. In the interest of space and clarity, we present the top five probabilities only. The rest of the results is available upon request from the authors. **Panel A – Multi-topic Papers**

	All Topics	Single Topic	Two Topics	Three Topics	Single Topic	Two Topics	Three Topics	All Topics
